# Final Report Ristorante Con Fusion – A restaurant App

Prepared by
Aryashree Pritikrishna

April 2019

# 1. Introduction

#### Summary

Ristorante Con Fusion it's a famous restaurant for fusion foods. In this web application user can view the featured foods, chef and details about the food with single page application and, the clear navigation that will enable users to quickly get the food and review details.

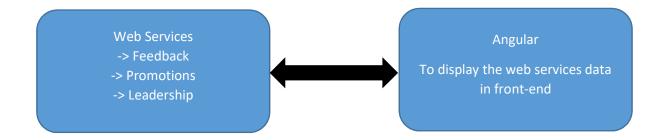

#### **Features**

- Featured dish, promotion and leaders display in homepage.
- Nice UI interaction between the pages like on data request loading the spinner and ease in/out for view pages.
- > Comment review in action.
- Rating slider for users.
- User friendly error reporting.
- > Storing the feedback details web services.

# 2. Design and Implementation

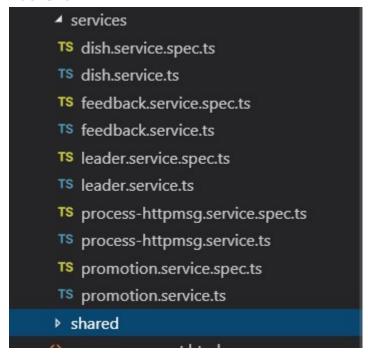

#### **System Design**

The system is design around the data model of feedback, promotions, leadership and dishes. The system contains multiple comments which was posted by the users. Each dish contains multiple comments.

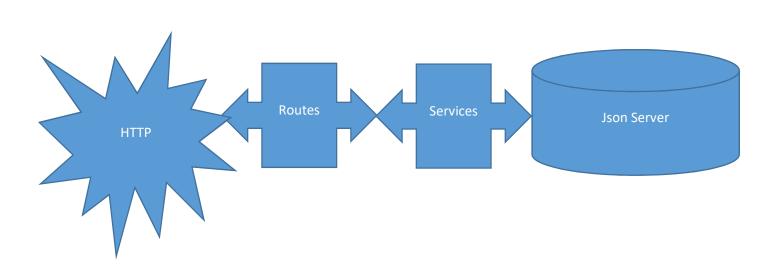

## **Implementation**

#### Backend

"Services" contains helper services and business logic. This package stands between the REST endpoints ("routes"). Those endpoints define the URLs and HTTP methods to interact with the backend. There's a separate router for each data model.

#### **Frontend**

```
■ app
  about
    animations
    app-routing
    contact
   directives
  dishdetail
    footer
    header
    home
    login
  menu
   services
  shared
 app.component.html
   app.component.scss
 TS app.component.spec.ts
 TS app.component.ts
 TS app.module.ts
  assets
environments
  _variables.scss
■ browserslist
favicon.ico
index.html
K karma.conf.js
TS main.ts
```

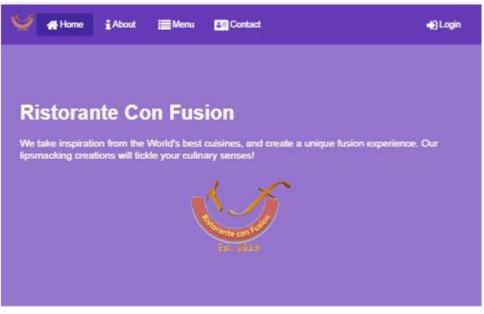

The frontend is based on components which have been introduced in Angular. A Component concludes controller and HTML partial to a new HTML element. This is useful to encapsulate behavior in single independent modules.

#### Libraries

- Angular as frontend library to implement the single page application
- Angular Material to design the application
- **JSON-server** to serve the services
- Protractor to write unit test for the backend
- Process HTTP msg to display http error message.

### **Screenshots**

#### **Conclusions**

- I was able to implement the main features of the project. Users can create boards, write messages and edit them later on.
- The most difficult part to implement was the service layer. Promises was new to me, so implementing the services with the corresponding read and write methods took some time.
